## Liquid-to-Air Thermoelectric Assembly Model CA-045-LA-24-00

### Description

Liquid-to-Air thermoelectric assemblies are used to cool (or heat) an object via liquid. Heat dissipated by an object will be absorbed by a liquid, transfered to a liquid heat sink and pumped by Peltier-modules to a heat sink with fan to discharge the heat to the environment. The liquid circuit is normally of a recirculating type with a pump. Because no refrigerant liquid (CFC's) is used, the assemblies are friendly for our enviroment. The coolers operate 100% on a DC-voltage. They are ready to use and the installation is easy. Our Liquid-to-Air series is available in several cooling capacities and voltages. Because we design and build our coolers in-house, we are able to build special versions quickly. Please ask for the possibilities.

## **Technical specifications**

Cooling power (at 0°C dT)  $: 46 \text{ Watt } (\pm 10\%)^*$ 

Supply : 24 VDC

CE / RoHS 2 compliant : yes
Packing : Individual carton box

\* at 25°C ambient temperature

Product photo (cold side)

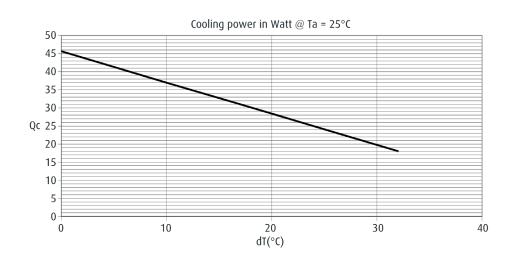

## Benefits & Application areas

#### **BENEFITS**

- Compact design
- High cooling capacity
- DC operation
- Easy installation
- Reliable solid-state technique

#### **APPLICATION AREAS**

- Laboratories
- Medical lasers
- Analytical instrumentation
- Thermal conductive enclosures
- Industrial lasers
- Semiconductor testing
